RISK REMINDER

Working Near Overhead Lines

While working near overhead power lines it is always important to know your surroundings. It is important to remember that the vertical clearance to overhead power lines ranges from 10-12 feet depending on the voltage.

Make sure that if you are dumping near overhead lines that you have plenty of room to dump your load. Also make sure that you put your bed down before taking off to prevent from hitting other power lines.

If operating a boom near overhead lines make sure you are paying attention to how close you are to the lines and where guidewires might be.
